Education

State University of New York at Buffalo August 2025 — December 2026
Master of Science in Computer Science (3.83/4 GPA)

University of Mumbai August 2020 — June 2024
Bachelor of Engineering in Computer Engineering (8.63/10 CGPA (~3.45/4.0 equivalent))

Experience

Software Development Intern May 2026 — August 2026
Channel Core

- Kept 500+ records synced daily with zero manual intervention by integrating 6 social platforms (Instagram, YouTube, TikTok, LinkedIn, Snapchat, X) via OAuth with automatic token refresh and credential rotation.
- Building production infrastructure serving 150+ creators — architecting separate dev/prod environments on Neon with automated S3 backups and branch protection, eliminating risk of dev changes affecting live users

Research Assistant (Part-Time) February 2026 — Present
SUNY Research Foundation — CUBS Lab (Prof. Srirangaraj Setlur)

- Automated grant scraping across 3 federal sources (NIH, grants.gov, PCORI) with a 10-worker async Python pipeline that throttles itself to avoid overloading target sites.
- Recovered funding fields on 100% of grant pages that single-call extraction missed, via an LLM pipeline (strict JSON schemas) splitting each page into 4 targeted extraction tasks.
- Achieved zero data loss end-to-end through failure-only persistence and automatic retries with backoff, upserting deduped records into MySQL.

Software Development Intern January 2026 — May 2026
Safety Knights

- Architected and shipped a production EHS job board currently in beta with 4,000 users, spanning an Express/Node.js API (75+ endpoints, AES-256 encryption), an Angular v17 SSR consumer app, and a standalone admin console across 3 independently deployable codebases.
- Built a full candidate pipeline with GridFS document storage, 5-stage status tracking, and 3 automated email flows, plus multi-axis job search and automated hourly listing expiration.

Software Development Engineer August 2024 — June 2025
CarWale [CarTrade Tech]

- Engineered and maintained the 'Oxygen Design System', a core library of 70+ reusable components in React and React Native that directly supported 80 million monthly users, achieving a 10% bundle-size reduction on critical pages via a new counter-based hashing system.
- Cut a two-week estimate to 2 days (5x faster) by leveraging AI-driven automation and prompt engineering to update 250+ files.

Projects

bro-cli June 2026 — July 2026
Cross-shell CLI alias manager preserving shell state (cd, env activation) across invocations

- Built single-binary Rust CLI (bash/zsh/fish/PowerShell/cmd) that emits shell code for the wrapper to eval, letting stored aliases mutate the live shell — cd, export, venv activation persist across runs.

Beacon June 2025 — August 2025
Real-time location-sharing application with granular permission controls

- Engineered a Unified Native-Web Bridge enabling a WebView-based UI to control native background services and retrieve real-time diagnostics, replacing a fully native solution with a web-based app for faster iteration.

Skills

Programming Languages: JavaScript, TypeScript, Python, Rust

Frameworks: React, Node.js, Next.js, Angular

Databases: PostgreSQL, MongoDB, MySQL

Infra/Tools: Git, GitHub Actions, AWS, Docker, GCP, OpenShift
